Jacob, observing stars from Madras, reported that he was certain he had found evidence of a planet circling the double star 70 Ophiuchi. For example, a planet in a distant orbit has a path that curves only a very little bit compared to a planet with a very small orbit.

It is written in the language of mathematics, and its characters are triangle. It also says that the same amount of force—the same push—will move a light object faster. Planetary Motion (Science Foundations) it will move a heavy object. These numbers are very small, but as far as scientists know, these measurements never change. In fact, not only can scientists gather a lot of good information in that short period of time, but they can actually bring more instruments to study a planet on a flyby mission—if the spacecraft is going to stick around, then it

would need extra fuel to enter orbit.
